

Base work for your build.

We don't build bases ourselves but we are forwarding the following information and ideas to you by way of helping you get your base built.

The importance of a level and firm base for a shed or summerhouse is often overlooked, probably as it doesn't get seen once a build is sat on top but it's vital for the longevity of your wooden outbuilding – whether you choose to purchase from us or anyone else.

The links below are to a couple of trade rating websites where the tradesmen get reviewed on their work and so are more likely to offer a good service. There's also some builders that use Facebook to advertise their services.

A self build option involves purchasing purpose built base crates. The idea being that you dig out the correct depth for these crates to be sited and fill the crates with pea gravel to keep them firmly in position. There's a link below to one of these products:

Disclaimer:

Please be aware that these suggestions are only ideas to help you with your base. As stated in our installation terms, we can only install on a level and firm base built to the correct dimensions of your order and cannot take responsibility for the base.
